

# EcahLang

A lightweight llm inference & serving

Why EcahLang

# Continuous Batching

Requests arrive at any time. ecahLang uses two async queues to handle them continuously

# Continuous Batching - FlashAttention

Continuous batching means different requests with different lengths in the same batch.

Traditional attention requires padding to the longest sequence. FlashAttention variable-length support solves this.

## The Problem: Padding Wastes Compute

## The Solution: Ragged Tensors via `indptr`

FlashInfer computes positions & batch\_indices from indptr automatically via `get_batch_indices_positions()`

# KV Cache problem

- **Internal Fragmentation:** over allocated due to unknown length
- **Reservation:** not used at the current step, but used in the future
- **External Fragmentation:** due to different sequence length

Only **20-40%** of KV Cache is utilized to store token states

# Paged KV Cache

Inspired by **virtual memory** and **paging**

## Memory management in OS

## Memory management in vLLM

# PagedAttention

- An attention algorithm that allows for storing continuous keys and values in non-contiguous memory space

# Logical & Physical Blocks

# Paged KV Cache

- Minimal internal fragmentation
  - Only happens at the last block of a sequence
  - Bounded by the block size
- No external fragmentation

| renowned |           |     |               |

Internal fragmentation

On average, the wasted space is less than **4%** of the kv cache space  
(**3-5x** improved memory util)

# KV Cache - FlashInfer

|                                                                                                 |                                                                                 |

| <b>Fused Sampling (1 kernel, not 4)</b><br>top_k_top_p_sampling_from_logits() - one cuda kernel | <b>Variable-Length Batching</b><br>Ragged tensors via indptr - no padding waste |
| <b>Batch Planning</b><br>wrapper.plan() - pre-compute metadata once per batch                   | <b>IO-Aware Tiled Attention</b><br>FlashAttention-style                         |

ecahLang's attention function is **~20 lines** because FlashInfer does all the heavy lifting.

# Reducing cpu overhead: CUDA Graphs

Baseline — CPU prepares, launches, then blocks

ITL: 26.3ms @ 1 user · 120.8ms @ 128 users

torch.compile — JIT compiles MLP/norm, less CPU overhead

ITL: 19.8ms @ 1 user · 75.9ms @ 128 users · ~1.6x faster

CUDA Graphs — record once, replay with single CPU call

ITL: 8.1ms @ 1 user · 44.2ms @ 128 users · ~3.3x faster

# Overlap Scheduler

## Without Overlap — CPU dead during GPU graph replay

CPU calls `graph.replay()` (fast!) but then blocks on `synchronize` — can't do anything until GPU finishes

### Without Overlap

```
graph.replay() launches all kernels (fast)
Then synchronize() blocks CPU
CPU sits idle during entire GPU replay
Next batch prep starts only after GPU done
```

# Overlap Scheduler

With Overlap Scheduler — CPU collects next batch during GPU graph replay

CPU calls `graph.replay()` on `fwd_stream`, then yields — collects next batch while GPU replays the graph

## With Overlap

```
graph.replay() on fwd_stream(non-blocking)
await asyncio.sleep(0) yields to event loop
CPU drains queue, collects next batch
fwd_stream.synchronize() — next batch already
ready
```

# Benchmarks - Prefill

Chunked prefill has significantly improved TTFT, especially under high concurrency, reducing first token latency from **~1s** to **~0.77s** at 128 users.

# Benchmarks - Decode

CUDA Graphs gave us roughly a 3x improvement in inter-token latency - dropping from **~120ms** to **~42ms** at 128 users.

# Benchmarks - In-flight requests

# Future outlook

1. Prefix Caching
2. LMCache
3. KV Cache offloading
4. Parallelism
5. Prefill-decode disaggregation
6. Speculative decoding
7. Quantization

# Source Code

 README

## ecahLang

Lightweight continuous batching inference engine for HuggingFace CausalLM models, built on [FlashInfer](#). The name "ecah" is inspired by [Aisyah](#), a lovely and popular Malaysian girl's name, a short and friendly nickname.

### Features

- Continuous batching with paged KV cache
- FlashInfer paged prefill and decode attention
- CUDA Graph decode
- torch.compile decode
- CUDA stream overlap schedule
- Pre-allocated pinned sampling buffers
- Chunked prefill

### Pre-requisites

```
curl -LsSf https://astral.sh/uv/install.sh | sh

uv venv --python 3.12
source .venv/bin/activate
```

### Installation

```
pip install git+https://github.com/Scicom-AI-Enterprise-Organization/ecahLang
```

URL: <https://github.com/Scicom-AI-Enterprise-Organization/ecahLang>

Thanks
